

ServoFlex – shaft coupling Type 328

Drive
elements are
our world.

Characteristics and features

- torque transmission is free of backlash and torsionally stiff
- wear-free and maintenance-free
- high misalignment values
- high strength and bending elasticity stainless steel disc pack
- membrane shape is optimized with finite element design methods
- small resultant restoring forces
- transmitted torque up to 25 Nm, depending on the angular misalignment
- recommended temperature range: -30 °C to 100 °C
use outside of this spectrum on request
- single and double joint designs

Mönninghoff power transmission represents an infinite variant diversity that is applied by all areas of modern mechanical engineering.

Our technologies are mostly designed to operate under extreme conditions. We offer high precision products for medical robotics, fail-proof security for aerospace technology or synchronization solutions for the packaging or printing industry.

We thus address customers who have the highest standards for their own machines or systems. To them, we can offer highly complex, application-specific solutions.

Match code

Mönninghoff shaft couplings are indicated by the following match code:

328 . A . B . 4

A coupling size

B design

other individual characteristics:

- bore size
- options of mounting and integrating

According to these characteristics, we design individual solutions concerning transmitted torque, engaging behavior or rotation speed.

Our engineers can assist with finding an application-specific coupling at any time. Together, we can develop individual and innovative solutions for extreme operating conditions.

Ordering example

Mönninghoff ServoFlex coupling
Type 328.14.4.4

Bore d	10 mm H7
Bore d ₁	12 mm H7
mounting option	A

Coupling size

When dimensioning a Mönninghoff ServoFlex coupling, several technical preconditions should be considered:

- Membrane coupling transmit torque without virtually any dampening. Therefore the size must be determined so that a possible peak torque - caused by drive or load - does not exceed the specified nominal torque (TKN). Therefore we recommend that the torque which have been determined theoretically are corrected with the appropriate safety or operating factor.

$$T_{KN} > T \cdot K_B \text{ oder } T_{KN} > T \cdot K_S$$

- As misalignment reduces the transmitted torque of the coupling, the values specified for TKN in the table must be taken into consideration depended on the angle of displacement. In the case of alternating operation and the demand for backlash free torque transmission, the alternating torque may not be exceeded.

$$T_{KW} > T \cdot K_B \text{ oder } T_{KW} > T \cdot K_S$$

- In the case of servo-drives and inverter controlled drives, possible maximum torque must be taken into consideration due to the interaction between motor and controller.

$$T_{Motor} = \frac{9550 \cdot P_{Motor}}{n}$$

- If clamping hubs or clamping elements are used, the max. torque which can be transmitted by the clamping connection must be taken into consideration.

T = torque

T_{KN} = nominal torque

T_{KW} = alternating torque

K_B = operating factor

K_S = shock factor

T_{Motor} = torque of the motor

P_{Motor} = power of the motor [kW]

n = max. speed [min⁻¹]

ServoFlex shaft coupling - Type 328

Coupling size - starting factor

If the starting factor is bigger than 2 times of the coupling torque, or if there are more than 50 starts/stops per hour, please consult our engineers.

Coupling size - angular misalignment factor

When calculating the angular misalignment factor, the radial and axial misalignment must also be taken into account.

angle misalignment

radial misalignment

axial misalignment

$$\Delta K_{\text{total}} = \Delta K_a + \Delta K_r + \Delta K_w \leq 100\%$$

modification of ΔK_a [mm] and ΔK_r [mm] in ΔK_{wa} [°] and ΔK_{wr} [°]

$$\Delta K_{wa} = \arcsin \frac{\Delta K_a}{0,75 \cdot D_1} [^\circ]$$

$$\Delta K_{wr} = \arcsin \frac{\Delta K_r}{x} [^\circ]$$

$$\Delta K_{wg} = \Delta K_w + \Delta K_{wa} + \Delta K_{wr} [^\circ]$$

X = distance of
 K_{wg} = total angular misalignment

K_{wa} = angular misalignment axial

K_{wr} = angular misalignment radial

ServoFlex shaft coupling - Type 328

Design 1.4

The Mönninghoff ServoFlex coupling is offered in many different designs.
 Design 1.4, single joint = equalization of axial and angular misalignment

Type 328, Design 1.4
 single joint
 connection option A:
 • stepped hub - stepped hub

only sizes
 14; 19; 25

Type 328, Design 1.4
 single joint
 connection option B:
 • stepped hub - full hub

only sizes
 14; 19; 25

Type 328, Design 1.4
 single joint
 connection option C:
 • full hub - full hub

Technical data design 1.4

Design 4.4

The Mönninghoff ServoFlex coupling is offered in many different designs.

Design 4.4, double joint = equalization of axial and angular misalignment and additional of radial misalignment

Type 328, Design 4.4

double joint

connection option A:

- stepped hub - stepped hub

only sizes

14; 19; 25

Type 328, Design 4.4

double joint

connection option B:

- stepped hub - full hub

only sizes

14; 19; 25

Typ 328, Design 4.4

double joint

connection option C:

- full hub - full hub

You need more?

Mönninghoff couplings can be combined with a variety of many other power transmission elements. Such complex high-tech systems can solve any application-specific tasks and can fulfill any customer-specific wishes.

In many cases, a combination of different drive elements is needed to solve the applications particular problems and difficulties. Being not just supplier but technological partner to our customers, our extensive engineering is part of extraordinary and challenging power transmission projects.

**Our product is the know-how,
with hardware as an added bonus.**
