

PROCESS + SPECIALITY

POLYURETHANE BELT PROGRAM

PRODUCT AND TECHNICAL INFORMATION

Company Profile

Gates is a multinational, leading manufacturer of technological forward-looking power transmission and conveyor belts made out of highly abrasion-resistant polyurethane used in various industries and applications.

Gates Polyurethane Timing Belts provide long-lasting, energy-efficient solutions for power transmission and linear applications. Available are open ended and truly endless belts with different sizes, designs and tooth shapes for various applications.

For processes requiring a specific belt design, contact Gates. Gates offers a variety of customized polyurethane belts to meet the most challenging requirements.

Our Service

With production and distribution partners worldwide Gates offers global service to solve your challenges. As a total integrated facility, Gates combines in-house extrusion, Molding as well as fabrication capabilities.

Our Quality

Specialization, research and quality control are the basis of Gates success. Gates keeps investing in quality, research and development in order to meet its customer's current and future demands. Our continuous development of our products and plants guarantees highest quality according to ISO 9001, ISO 14001 and ISO 18001.

REACH - Registration, Evaluation, Authorization of Chemical substances

Gates takes its responsibility for human health and the environment very seriously and complies with the requirements laid down in the REACH regulation. All substances in our belts requiring registration will be duly registered in the central database run by the European Chemicals Agency (ECHA).

POLYURETHANE BELT PROGRAM

POLYURETHANE BELTS

Our product quality is highlighted in the details. — Narrow tolerances and perfect tooth engagement are guaranteed.

Gates Polyurethane Timing Belts are made out of high quality, abrasion-resistant polyurethane in combination with high strength steel or aramid cords. Nearly every extruded belt type can be additionally customized by adding coatings and profiles or special machining.

ATTRIBUTES

- › Low-maintenance polyurethane construction
- › High tensile strength
- › Abrasion and UV resistant
- › Low pre-tension
- › Excellent durability vs. moisture
- › Temperature resistant from -5° C up to +70° C
Extended service temperature range is available on request

CHEMICAL ATTRIBUTES

- › Non-aging
- › High chemical resistance
- › High durability vs. detergent
- › Excellent durability vs. oil and fat
- › Conditionally permanent vs. acids and bases

TECHNICAL DATA-COEFFICIENT OF FRICTION

› Polyurethane	vs. Steel	dry	0.5	up to 0.7
› Polyurethane	vs. Aluminum	dry	0.5	up to 0.6
› Polyurethane	vs. UHMWPE	dry	0.2	up to 0.4
› Polyamide	vs. Steel	dry	0.2	up to 0.4
› Polyamide	vs. UHMWPE	dry	0.1	up to 0.3
› ECO fabric	vs. Steel	dry	0.1	up to 0.3
› ECO fabric	vs. PE-UHMW	dry	0.05	up to 0.15

TOOTH PROFILES

IMPERIAL TOOTH PROFILE

- PITCH: XL / L / H / XH
- Attributes: > Low tooth profiles with large surface area
- Applications: > Sliding conveyor applications

T TOOTH PROFILE

- PITCH: T2.5 / T5 / T10 / T20
- Attributes: > Developed to enable higher load carrying
> Capacity combined with low backlash
- Applications: > Sliding conveyor applications

AT TOOTH PROFILE

- PITCH: AT5 / AT10 / AT20
- Attributes: > Developed to enable higher load carrying
> Capacity combined with low backlash
- Applications: > Linear positioning
> Power transmission

HTD® TOOTH PROFILE

- PITCH: HTD®5 / HTD®8 / HTD®14
- Attributes: > Higher tooth meshing
> Equal tension distribution and load transmission
> Reduced wear and noise characteristics
- Applications: > Linear / rotary positioning
> Power transmission

HPL® TOOTH PROFILE

- PITCH: HPL®14
- Attributes:
- › High-performance synchronous belt
 - › PolyChain® 14M tooth shape
 - › Higher carrying capacity due to PCGT14 pulley
- Applications:
- › Linear positioning
 - › Lifting

STD TOOTH PROFILE

- PITCH: STD5 / STD8
- Attributes:
- › Reduced wear and noise characteristics
- Applications:
- › Linear positioning
 - › Power transmission

FLAT BELTS

- PITCH: BFL20 / BFL32 / BFL38 / BFL48
- Attributes:
- › Easy belt guiding
 - › Small pulley diameters
- Applications:
- › Lifting

WIDE BELTS

- PITCH: WT10 / WH / GMT3™
- Attributes:
- › Widths up to 450mm available
 - › Alternative to plastic modular chains and flat belting
- Applications:
- › Synchronous conveying
 - › Food industry applications

INFORMATION

Gates Linear Timing belts are manufactured in different sizes, constructions and tooth shapes. The wide range of various constructions offers the exact solution for quite every application. Linear belts are available in different types, such as roll stock, open ended (long length), pre-punched or endless, thermal welded belts.

Gates linear belts are designed to ensure high class performance for both, power transmission and linear applications. And they are suitable for a broad range of demands, speeds and applications.

ATTRIBUTES

- › Thermoplastic polyurethane construction
- › High tensile strength and stiffness
- › Parallel cord construction for uniform tensioning
- › Smooth, low-noise operation
- › Temperature range from -5° C up to +70° C
- › Extended service temperature range is available on request
- › FDA Approval for:
XL / L / H / T5 / T10 / AT10 / WT10 / WH / BFL20-Aramid / BFL20-RKV / BFL32-Aramid / BFL32-RKV
- › EU Food Approval for:
T5 / AT5 / T10 / AT10 / GMT3™ / WT10 / WH / WR10

APPLICATIONS

- › Conveying- and handling equipment
- › Linear applications
- › Synchronous conveying applications
- › Automatic assembly machines
- › Door drives
- › Textile industry

SELF TRACKING BELTS

Gates Self Tracking Belts are a composed construction of Gates' standard polyurethane belts and specially designed polyurethane V-Guides, which provide highest flexibility and allow the use of small pulley diameters. Self tracking belts can be manufactured in two different production processes:

- › Fabricated V-Guides can be combined with any belt type and belt width.
- › Integral V-Guides are integrated by co-extrusion in the belt producing process and ensure higher strength and consistency.

ATTRIBUTES

- › V-Guides can be added to nearly every belt type.
- › Synchronous operations
- › Operation without flanged pulleys possible
- › Reliable tracking which is not affected by lateral forces
- › Reduction of lateral movement

APPLICATIONS

- › Long length conveying
- › Industrial handling
- › General conveying
- › Linear / rotary positioning

PROCESSING OPTIONS

- › Backings *Further information on page 124*
- › Profiles *Further information on page 138*
- › Special processing *Further information on page 146*

GATES BLACK-FLAT — Our Polyurethane Flat Belts are available in various constructions

Gates BLACK-FLAT belts are extruded flat belts made out of high strength Polyurethane. Commonly they are used in lifting and conveying applications. Our BLACK-FLAT belts are typically sold as open ended belts. Usually they are attached at one or both ends in the application with clamping plates or our new FIX-FLAT.

Our flat belts are adapted to a wide range of mechanical requirements. With combinations of different types of polyurethanes and cords we offer a wide variety of belts.

We also have a range of belts specially designed for applications in the food processing industry. These belts have FDA and EU approval.

Our latest development FIX-FLAT, the flat belt clamp, enables the secure clamping of any flat belts at both ends easily, quickly and safely. Patent applied for.

FEATURES

- › Smooth, vibration free operation
- › High strength combined with low elongation
- › Sealed belt edges result in no cord fraying
- › Easy belt guide with flanged pulleys or guiding rails
- › No re-tensioning required

TYPICAL APPLICATIONS:

- › Heavy load lifting or lowering
- › Exercise machines
- › Conveying applications
- › Applications with small pulley diameters

PROCESSING OPTIONS:

FIX-FLAT — The new Flat Belt Clamp holds all Types of Flat Belts easily and safely!

With our latest, patent pending process, you can clamp all belts easily, quickly and safely. The FIX-FLAT process is suitable for all BLACK-FLAT belt constructions. More information is available on request!

FEATURES

- › Suitable for all types of flat belts.
- › Easy
- › Safe
- › Fast

FINISHING

INFORMATION

Gates Wide Belts are commonly used in applications which require an exact product positioning. A parallel construction of high strength aramid cords ensure even tension and smooth running characteristics. The belt construction of high-strength polyurethane is cut resistant and non-marking. Those belts stand out in addition of easy cleaning and smooth belt drive and are ideal replacement for plastic modular belts and conveyor belts.

ATTRIBUTES

- › Easy to clean
- › Cut resistant
- › Widths up to 450 mm available
- › Suitable for synchronous conveying applications
- › No cord exposure at the edges of the belt
- › Low-noise, smooth operation
- › FDA approval for: WT10 / WH and GMT3™
- › EU food approval for: GMT3™

APPLICATIONS

- › Synchronous conveying applications
- › Bulk conveying
- › Food and confectionary conveying
- › Clean room or wash down environments
- › Hygienic applications

INFORMATION

ENDLESS BELTS

**GATES SYNCHRO-POWER® -
TRULY ENDLESS (CAST) BELTS**

Certain power transmission and high performance positioning applications require more strength and stiffness than a welded belt can provide. Gates offers two types of truly endless belts to meet these demands.

Gates Synchro-Power® Cast Belts are cast on fixed molds and have continuously wounded steel cords. They are manufactured in various exact sizes, constructions and pitches to fulfill customer requirements.

Cast Belts offer premium capacity for power transmissions and linear applications while fitting a broad range of loads, speeds and applications.

ATTRIBUTES

- › Molded, thermo-set polyurethane construction
- › Full load and power transmission based on endless cords
- › Excellent abrasion resistance
- › Smooth, low noise, non-marking operation
- › High tooth strength reduces deforming under load
- › Excellent resistance to chemicals

APPLICATIONS

- › Paper processing industry
- › Wood processing industry
- › Glass processing industry
- › Textile industry
- › Packaging machines
- › Exercise equipment

PROCESSING OPTIONS

- › Backings *Further information on page 124*
- › Special processing *Further information on page 146*

FABRICATION CAPABILITIES

- › Pitches T2,5 / T5 / T10 / DT5 / DT10 / AT5 / AT10
- › Widths 4 mm up to 380 mm
- › Lengths 120 mm up to 2 250 mm
- › Polyurethane 88 Shore A (Standard)
- › Tension members Steel cord (Standard)
Aramid cord available on request
- › Polyamide fabric Not available

Further constructions are available on request.

INFORMATION

ENDLESS BELTS

TRULY ENDLESS FLEX BELTS

Flex Belts are truly endless extruded with helically wound steel cords in different sizes, constructions and pitches.

ATTRIBUTES

- › Extruded, thermoplastic polyurethane construction
- › High performance and power transmission based on truly endless cords
- › Synchronous tracking

APPLICATIONS

- › Wood processing industry
- › Textile industry
- › Conveying machines
- › Foiling machine
- › Power transmission
- › Highly stressed conveying applications

PROCESSING OPTIONS

- › Backings *Further information on page 124*
- › Special processing *Further information on page 146*

FABRICATION CAPABILITIES

- › Pitches H / T5 / T10 / T20 / AT5 / AT10 / AT20 / ATL10 / ATL20
HTD®5 / HTD®8 / HTD®14
- › Widths 10 mm up to 100 mm
- › Lengths 1 550 mm up to 23 500 mm
- › Polyurethane 92 Shore A (standard)
- › Tension members Steel cord (standard)
- › Polyamide Fabric Polyamide fabric on tooth side (NT)

Further constructions are available on request.

COATED BELTS

Most belt types can be modified with a coating to achieve a desired coefficient of friction, abrasion resistance or thickness. Gates offers more than 20 backings in categories such as polyurethane, rubber, foam, PVC and special backings to meet your requirements.

All backings can be modified mechanically on request. Gates customizes belts especially according to your requirements.

PROCESSING OPTIONS

- › Grinding
- › Milling
- › Sandwich Belts
- › Grooves
- › Holes

Further information on page 146

ATTRIBUTES

- › Low vibration and quiet operation
- › Reduced noise characteristics
- › Adaption of friction

APPLICATIONS

- › Metal stamping industry
- › Feeding and pulling applications
- › Paper handling
- › Glass conveying
- › Food industry
- › Cardboard conveying

FABRICATION CAPABILITIES

- | | |
|------------------------------------|---------------|
| › Minimum width | 10 mm |
| › Maximum width | 450 mm |
| › Minimum length | 480 mm |
| › Maximum length / welding process | No limitation |
| › Maximum length / gluing process | No limitation |

Further information regarding backings, thicknesses or special dimensions is available on request.

POLYURETHANE (PU) BACKINGS

ENDLESS BELTS

FINISHING

INFORMATION

Polyurethane is the most abrasion-proof, resilient and durable backing. Polyurethane backings are available in different thicknesses and hardnesses and are applied by welding process on to the belt.

ATTRIBUTES

- › Excellent friction
- › Good abrasion resistance
- › Good durability vs. chemicals
- › Excellent durability vs. oil and fat
- › Available with FDA / EU food approval

APPLICATIONS

- › Stone processing industry
- › Wood processing industry
- › Glass processing industry
- › Card sheet processing industry
- › Cardboard transport
- › Packaging industry
- › Feeding and pulling applications
- › Ascending conveyor

Material	Color	Hardness	Material Thickness	Minimum Ø / Ø Factor	Approval	Backing

FINISHING

INFORMATION

Rubber backings are commonly used in industries such as wood processing, glass processing and ceramics industry based on their high coefficient of friction and temperature resistance as well as good abrasion resistance. Rubber backings are applied by adhesive bonding.

ATTRIBUTES

- › Excellent friction
- › Good abrasion resistance
- › Good durability vs. temperature and resistance to atmospheric conditions
- › Flexibility at low temperatures
- › Available with FDA Approval

APPLICATIONS

- › Wood processing industry
- › Metal stamping industry
- › Paper processing industry
- › Textile processing industry
- › Packaging industry
- › Feeding and pulling applications
- › Pharmaceutical / cosmetic industry

POLYVENYLCHLORID (PVC) BACKINGS

TIMING BELTS

SELF TRACKING

FLAT BELTS

WIDE BELTS

ENDLESS BELTS

FINISHING

INFORMATION

Due to various backing characteristics, Polyvinylchlorid (PVC) backings are commonly used in glass processing, wood processing, ceramic and packaging industries. Various FDA/EU approvals for different PVC backings allow applications in sectors such as food and where good hygiene is required. PVC backings are applied by adhesive bonding.

ATTRIBUTES

- › Good durability vs. acids and chemicals
- › Good resistance to atmospheric conditions
- › Very adhesive
- › Available with FDA/EU approval
- › Available with various surface textures such as rough top and saw tooth

APPLICATIONS

- › Wood processing industry
- › Glass processing industry
- › Stone processing industry
- › Paper processing industry
- › Labeling industry
- › Packaging industry
- › Pharmaceutical / cosmetic industry

SPECIAL BACKINGS - SPECIAL FABRIC

In addition to our standard backing types, we offer special backings, such as Novo Fleece and Chrome Leather. Both backings are applied by adhesive bonding.

NOVO FLEECE

- | | |
|-----------------------|---|
| > Material: | Polyester |
| > Color: | Anthracite |
| > Hardness: | Incapable of measurement |
| > Material Thickness: | 1,2 mm |
| > Mindestdurchmesser: | Ø 25 mm |
| > Attributes: | Suited for high temperature ranges
Good durability vs. oil and fat |
| > Applications: | General conveying applications, glass processing |

CHROME LEATHER

- | | |
|-----------------------|---|
| > Material: | Leather |
| > Color: | Grey |
| > Hardness: | 65 Shore A |
| > Material Thickness: | 2 mm / 3 mm |
| > Mindestdurchmesser: | Ø 90 mm |
| > Attributes: | Excellent coefficient of friction
Good abrasion resistance
Excellent oil resistance |
| > Applications: | General conveying applications |

POLYAMIDE FABRIC

Polyamide fabric on tooth and/or back reduces the coefficient of friction and provides smooth and enhanced operation characteristics for custom designed applications. Polyamide fabric is added to the belt during the extrusion process.

ATTRIBUTES

- > low coefficient of friction
- > High wear resistance
- > Good sliding attributes
- > Low noise operation
- > Good durability vs. oil and fat

APPLICATIONS

- > Accumulating conveyor
- > Sliding applications

POLYAMIDE FABRIC ON TOOTH SIDE

- › Code: NT / Nylon® Tooth
- › Color: Green

POLYAMIDE FABRIC ON BACK

- › Code: NB / Nylon® Back
- › Color: Green

POLYAMIDE FABRIC ON TOOTH AND BACK

- › Code: NTB / Nylon® Tooth and Back
- › Color: Green

SPECIAL FABRIC

ECO Fabric offers both, antistatic features as well as an extremely low coefficient of friction. Depending on its application area ECO also provides an extended service life in comparison to the standard polyamide fabric. The special antistatic fabric is available for standard pitches such as T5 / T10 / AT5 / AT10.

ECO FABRIC ON TOOTH AND BACK

- › Color: Anthracite

Further backings, thicknesses and special dimensions are available on request.

FINISHING

PROFILED BELTS

Gates Timing Belts can be customized with welded profiles to meet specific application requirements. The molded profiles are made of tough polyurethane and become an integral part of the belt through thermal bonding. Profiles can be manufactured in nearly any shape and construction.

Our timing belts with welded profiles are optimal for applications in packaging, general conveying and other automation equipment applications.

Choose from over 2 000 existing profiles available from Gates's extensive mold inventory.

ATTRIBUTES

- › Available for all standard pitches
- › Non-marking, durable design
- › Over 2 000 existing shapes and constructions
- › Widths up to 18" / 450 mm available
- › Thermal bonding process fuses belt and profile together

APPLICATIONS

- › Pushing applications
- › General conveying applications
- › Glass conveying
- › Food conveying
- › Hygienic industry
- › Textile industry
- › Wood processing industry
- › Synchronous conveying applications

FABRICATION CAPABILITIES

- | | |
|------------------|--------------|
| › Minimum length | 500 mm |
| › Maximum length | 25 000 mm |
| › Maximum width | 450 mm / 18" |

FINISHING

INFORMATION

Over 2.000 profile designs are already available from Gates extensive mold inventory. Our application engineers will help you to design new, custom built profiles which will fit your application.

Ultimate performance can be achieved by following the design guidelines outlined below:

1. PROFILE SPACING

It is recommended that the profile spacing "A" correspond with the pitch of the belt. This allows the best spacing tolerances, and minimizes the effects of the belt's overall length tolerance on the profile spacing. Profiles can be spaced on non-Pitch increments. However, if non-Pitch spacing is used, the cumulative tolerance of the belt length must be considered.

Please add the Profile Spacing Tolerance of ± 0.2 mm to calculate the profile spacing „A“ as follows:

Example

Profile Spacing Tolerance for pitch type T10: ± 0.54 mm

Profile Spacing "A" (notional value): 1 000 mm

Resultant positional tolerance: 1 000 mm ± 0.74 mm for pitch type T10

Tighter tolerances for profile spacing are available. Please contact Gates applications engineering for detailed information.

Pitch Tolerance for all Belt Types	
T / HTD® / STD / Imperial Pitches	± 0.54 mm per m
AT Pitches	+ 0.27 mm / -0.54 mm per m

2. PROFILE DIMENSIONS

The most important considerations while dimensioning a profile are the size of the base of the profile ("foot" of the profile) and the position of the profile on the belt. The profile thickness can affect the flexibility of the belt, and can determine the minimum allowable pulley diameter. The flexibility of the belt can be maximized, however, by positioning the profile directly over the tooth of the belt. As the thickness of the foot of the profile increases, the minimum pulley diameter in the system must be increased according to the table below:

Tolerances	
Profile Width Profile Length	± 0.25 mm / ± 0.01 " ± 0.25 mm / ± 0.01 "
The height tolerance of a profile in consequence of the fusion of the profile and belt at the welding area	+ 0.25 mm / -0.5 mm + 0.01" / -0.02"

Minimum Number of Teeth of Pulley for Profiles located over Tooth

Profile Foot Thickness (Inch)	1/16	1/8	3/16	1/4	5/16	3/8	7/16	1/2	5/8	3/4

INFORMATION

3. PROFILE STRENGTH

The strength, and therefore the capacity of the profile depends primarily on the size of the welded profile foot.

The strength of the profile is affected by the type and direction of the force applied to it. Under high loads, the failure mode will normally be either bending or distortion of the profile and belt, or in some cases, the polyurethane may actually tear. The strength of the profile is approximately 6 N/mm^2 according to the drawing opposite.

4. WIDE BASE PROFILES OR PROFILES WITH RELIEF

For profiles requiring a wide base, such as pushers, one foot should be left unwelded. This allows for flexing around the pulley yet it remains rigid when loaded.

5. SEGMENTED PROFILES

If large profiles are required as carriers, then it is necessary, that they are either segmented or slotted.

6. PROFILES WITH HOLES

Profiles with holes for securing paddles or other attachments can be produced. Holes are either drilled before bonding, or are molded into the profile depending upon the volume and requirements of the application. Tolerances of the hole placement depends upon whether the holes are drilled or molded.

The tolerance of the hole from the belt surface is subject to the bonding process of the profile foot and the belt surface. Generally, tolerances are as shown on the right-hand side

7. PROFILES WITH INSERTS

Profiles can be molded with metallic inserts. These are particularly useful in some applications to replace roller chains with attachments.

The actual inserts can either be manufactured by Gates or provided by the customer.

8. FLASH BEAD

The welding process can cause a weld bead of polyurethane between belt back and the lower profile edge. This can be removed on customer request.

9. PERPENDICULARITY

All profiles are perpendicular to $\pm 1^\circ$.

10. ORDERING

When ordering a profiled belt, it is advisable to submit a drawing of the profiled belt. For your convenience standard drawing forms are available from our Applications Engineering Department. Once a design is finalized, Gates will submit the drawing to the customer for approval. This custom belt drawing numbers should be used for future ordering.

PROFILE SELECTOR

Our online Profile Selector Tool allows you to:

- › Find the right profile for your application
- › Download of drawings for each selection
- › Review minimum pulley recommendations
- › Go to our website: www.gatesmectrol.com
- › On the right hand side you will find the item *Tool Set*
- › Click on *Profiles Selector 2* to start the application

Please contact our Applications Engineering group for special profile shapes, dimensions or tolerances.

INFORMATION

Gates offers further finishings for belts to achieve a variety of application requirements. From grinded edges or surfaces to tight tolerances, punching or machining holes and slots to CNC machining of three dimensional contours - Gates provides for all needs customized solutions.

Milling

Minimum Length	500 mm
Maximum Length	30.000 mm
Minimum Width	10 mm
Maximum Width	450 mm

Punching

Minimum Length	500 mm
Maximum Length	30.000 mm
Minimum Width	10 mm
Maximum Width	450 mm
Minimum Hole Diameter	1,0 mm
Maximum Hole Diameter	10 mm

Grinding

Minimum Length	480 mm
Maximum Length	No Limitation
Minimum Width	10 mm
Maximum Width	450 mm

Removing individual teeth

For precise positioning of deats

Slotting

The flexibility can be increased by cross grooving thick coatings

Our Applications Engineering Department will help you with your custom requirements.

ADVANTAGES

- > Unlimited adaptability for nearly all dimensions, contours and configurations
- > Combination of flexible base belt manufacturing and additional fabrication in one hand.

EXAMPLE OF USE

- > Vacuum conveying belts for pulling applications

1. ABBREVIATIONS

Please consider the following abbreviations and symbols for calculation basis:

a	Acceleration [m/s ²]	g	Gravitational Acceleration [m/s ²]
A_V	Vacuum Area [m ²]	L	Timing Belt Length [mm]
β	Angle of Inclination [°]	l	Gauge Length during Frequency measurement [mm]
c_R	Overall Stiffness [N]	$L1$	Tight Side Length [mm]
c_{sp}	Belt Stiffness [N]	$L2$	Slack Side Length [mm]
d	Diameter	M	Torque
Δx	Elongation [mm]	m	Mass [kg]
Δx_{Pos}	Positional Deviation [mm]	m_a	Mass of accumulated Good [kg]
f	Frequency [Hz]	m_e	Mass of Counter Weight [kg]
F_1	Tight Side Belt Force [N]	m_F	Mass of Transported Goods [kg]
F_{1all}	Allowable Belt Force [N]	μ	Coefficient of Friction between Belt and Support
F_{1max}	Maximum occurring Belt Force [N]	μ_a	Coefficient of Friction between Belt and transported Material
F_{2opt}	Optimal Slack Side Force [N]	n	Revolutions per minute [1/min]
F_a	Acceleration Force [N]	p	Vacuum [N/m ²]
F_{Break}	Ultimate Tensile Strength [N]	P_{Motor}	Motor Power on Output Shaft [kW]
F_e	Effective Force [N]	r_{pulley}	Radius of Driver Pulley [mm]
F_{eall}	Allowable Effective Force [N]	Si_{Break}	Safety Factor on Breaking Force
$F_{eallapp}$	Maximum Allowable Effective Force Application [N]	Si_{F1}	Safety Factor on allowable Belt Force
F_f	Friction Force [N]	Si_{Fe}	Safety Factor on Allowable Effective Force
F_{Fa}	Friction Force during accumulation [N]	t_m	Tooth in mesh Factor
F_{FV}	Friction Force due to Vacuum [N]	T_{Motor}	Torque of Output Shaft [Nm]
F_g	Gravitational Force [N]	t_v	Speed Factor
F_{pre}	Force for Pre-tensioning [N]	v	Speed [m/sec]
F_{Stress}	Load Factor	z_m	Teeth in mesh
F_w	Externally applied working load [N]		

2. FORCES / FORCES FOR TIMING BELT DRIVES

a. Conveying Applications

b. Linear Positioning

c. Closed Power Transmission Drives

d. Lifting Applications

3. BASICS

a. Load Factor F_{Stress}

If no real-life testing results are available for the design of timing belt applications we recommend a load factor for calculating the effective force F_e , associated forces for pre-tensioning F_{pre} and tight side belt force F_1 .

Negative effects on the timing belt service life such as shocks are avoided through the Load Factor. The following list is provided as a guide for establishing a suitable factor:

Load	Load Factor	Examples
Uniform	1,2 ... 1,5	Conveyor for light goods, vial filling systems, medical devices, gauges, light wood processing machines, light bearing technology, linear motion slides
Weak impact load	1,5 ... 1,8	Wood processing machines, bearing technology, rack feeders, lathes, washing machines, mixing machines, vibration testing machines
Average impact load	1,8 ... 2,2	Hoisting devices, textile machines, extruders, paper handling
Heavy impact load	2,2 ... 2,5	Brickworks, molding press, coining machines, hammer mills

b. Tooth in mesh Factor t_m / Speed Factor t_v

The factors listed below are required to correct the Allowable Effective Force:

table 1

Tooth in mesh Factor t_m	
No. of Teeth in mesh	Tooth in mesh Factor
z_m	t_m
3	0.39
4	0.5
5	0.59
6	0.67
7	0.74
8	0.8
9	0.85
10	0.89
11	0.92
12	0.95
13	0.97
14	0.99
15	1

table 2

Speed Factor t_v	
Speed	Factor
m/s	t_v
0	1
1	0.99
2	0.98
3	0.97
4	0.95
5	0.93
6	0.9
7	0.87
8	0.84
9	0.81
10	0.77

c. Braking / Emergency Shutdown

For the following calculations the review of the peripheral forces occur due to normal braking maneuvers and especially emergency operations are of highest interest.

If the forces during these operation are bigger than the tangential forces based on lateral movement, further calculation of the force for pre-tensioning and the allowable belt force are needed on the basis of higher loads.

4. CALCULATION OF CONVEYING APPLICATIONS

a. Calculation of Effective Force F_e

The effective force F_e at the driver pulley is derived from the sum of all individual forces resisting the belt motion. The individual loads contributing to the effective force must be identified and calculated based on the loading conditions and drive configurations. To determine the Effective Force please use the method for conveying as follows:

$$F_e = \sum F_{\text{Resistance}} \times F_{\text{Stress}}$$

i. Friction Force F_F

The friction force between the timing belt and the slider bed due to weight of the conveyed good vertically to the direction of conveyance.

$$F_F = \mu \times g \times m_F \times \cos\beta$$

ii. Friction Force during accumulation F_{Fa}

The friction force between the timing belt, slider bed and the conveyed Material due to the mass component of the accumulated Material vertically to the direction of conveyance.

$$F_{Fa} = (\mu + \mu_a) \times g \times m_a \times \cos\beta$$

iii. Friction Force due to Vacuum F_{FV}

The friction force between the timing belt and the slider bed due to the vacuum for fixation of conveyed goods

$$F_{FV} = \mu \times p \times A_V$$

iv. Gravitational Force F_G

Force due to the mass component of the conveyed good parallel to the direction of conveyance.

$$F_G = m_F \times g \times \sin\beta$$

v. Acceleration Force F_a

Force to accelerate the mass of the conveyed good.

$$F_a = m_F \times a$$

vi. Further Forces

Motion resistance on the basis of belt mass, idler or similar are normally insignificant, but may have a decisive influence on the total value of the effective force and therewith on the belt load as well. The importance of mentioned influences has to be estimated throughout the calculations – in extreme cases the component forces must be calculated and considered.

b. Calculation of Force for Pre-tensioning F_{pre}

i. Real calculated Pre-tension

For trouble-free operation, it is necessary that the slack side does not fall below a certain tension. The pre-tension prevents jumping of the pulley teeth during belt operation. In order to collect the pre-tension, the optimal slack side force has to be ascertained as follows:

$$F_{2opt} = (0,1...0,3) \times F_U$$

Higher values are recommended for longer belt lengths.

Assuming an optimal slack side force the force for pre-tensioning is calculated considering the tight side length L_1 and the total timing belt length L as follows:

$$F_{pre} = F_{2opt} + F_e \times \frac{L_1}{L}$$

ii. Minimum Factor for Pre-tensioning

In most cases the selection of the belt type and its width is not carried out by existing applied loads, but on the geometry of the transported material. In most cases the result of this choice is an oversized belt drive the required pre-tension can hardly be determined based on calculation bases. For proper operation the Factor for pre-tensioning should be set as follows:

$$F_{pre} = 0,3 \times F_{1all}$$

c. Calculation of Tight Side Belt Force F_1

In the worst case the tight side belt force results as follows (conveyor moving at full load):

$$F_1 = F_e + F_{pre}$$

d. Belt Selection

To select the matching application for the belt type and width by using the values determined above (F_e and F_1) have to be compared with the valid data from our catalogue. After the first selection, the resulting pulley teeth have to be detected. The determined number of teeth and the angle of contact are the basis for the number of teeth which are constantly engaged to the pulley and which can be used for power transmissions.

The allowable effective force F_{eall} for the number of teeth smaller than 15 has to be rectified with the help of a tooth in mesh factor t_m which can be taken from *table 1*. The same method is allowed for conveying velocity. The needed speed factor t_v for speed can be taken from *table 2*. The outcome is a maximum allowable effective Force Application as follows:

$$F_{eallapp} = F_{eall} \times t_m \times t_v$$

$F_{eallapp}$ and F_{1all} should be larger than the actual prevailing forces in the application.

$$F_{eallapp} > F_e$$

$$F_{1all} > F_1$$

c. Calculation of Safety Factor SF

- i. Safety factor on allowable effective force SF_{F_e}

$$SF_{F_e} = F_{eallapp} / F_e$$
- ii. Safety factor on allowable belt force SF_1

$$SF_1 = F_{1all} / F_1$$
- iii. Safety factor on ultimate tensile strength SF_{Break}

$$SF_{Break} = F_{Break} / F_1$$

5. CALCULATION OF LINEAR APPLICATIONS

a. Calculation of Effective Force F_e

The effective force F_e at the driver pulley is derived from the sum of all individual forces resisting the belt motion. The individual loads contributing to the effective force must be identified and calculated based on the loading conditions and drive configurations. To determine the effective force please use the method for conveying as follows:

$$F_e = \sum F_{Resistance} \times F_{Stress}$$

- i. Friction Force F_F
 The friction force between the conveyed material and the storing vertically to the direction of conveyance.

$$F_F = \mu \times g \times m \times \cos\beta$$
- ii. Gravitational Load F_G
 Force due to mass component parallel to the direction of conveyance.

$$F_G = m \times g \times \sin\beta$$
- iii. Acceleration Force F_a
 Force to accelerate the mass of the moved goods.

$$F_a = m \times a$$

iv. Further Forces

Motion resistance due to belt mass, idler or similar are normally insignificant, but may have a decisive influence on the total value of the effective force F_e and therewith on the belt load as well. The importance of mentioned influences has to be estimated throughout the calculations – in extreme cases the component forces must be calculated and considered.

b. Calculation of Force for Pre-tensioning F_{pre}

For trouble-free operation, it is necessary that the slack side does not fall below a certain tension. The pre-tension prevents jumping of the pulley teeth during belt operation. In order to collect the pre-tension, the optimal slack side force has to be ascertained as follows:

$$F_{2opt} = (0,1 \dots 0,3) \times F_e$$

Higher values are recommended for longer belt lengths.

Assuming an optimal slack side force, the force for pre-tensioning is calculated considering the tight side length L_1 and the total timing belt length L as follows:

$$F_{pre} = F_{2opt} + F_e \times \frac{L_1}{L}$$

c. Calculation of Tight Side Belt Force F_1

In the worst case the tight side belt force results as follows (application moving at full load):

$$F_1 = F_e + F_{pre}$$

d. Belt Selection

To select the matching application for the belt type and width by using the values determined above (F_e and F_1) have to be compared with the valid data from our catalog. After the first selection, the resulting pulley teeth have to be detected. The determined number of teeth and the angle of contact are the basis for the number of teeth which are constantly engaged to the pulley and which can be used for power transmissions. The allowable effective force F_{eall} for the number of teeth smaller than 15 has to be rectified with the help of a tooth in mesh factor t_m which can be taken from **table 1**. The same method is allowed for conveying velocity. The needed speed factor t_v for speed can be taken from **table 2**. The outcome is a maximum allowable effective force application as follows:

$$F_{eallapp} = F_{eall} \times t_m \times t_v$$

$F_{eallapp}$ and F_1 should be larger than the actual prevailing forces in the application.

$$F_{EallAn} > F_U$$

$$F_{1all} > F_1$$

e. Calculation of Safety Factor SF

- i. Safety factor on allowable effective force SF_{FE}

$$SF_{FE} = F_{eallapp} / F_e$$
- ii. Safety factor on allowable belt force SF_1

$$SF_1 = F_{1all} / F_1$$
- iii. Safety factor on ultimate tensile strength SF_{Break}

$$SF_{Break} = F_{Break} / F_1$$

f. Clamp Plates

The clamp plates should be accomplished that at least 8 teeth per belt end can be clamped. During the assembling process please consider to equally clamp the belt – the belt height has to be reduced by at least 0,2 - 0,3 mm.

6. CALCULATION OF CLOSED POWER TRANSMISSION DRIVES

Closed power transmission drives should be always realized as truly endless cast or flex belts. The use of endless welded timing belts is not recommended.

a. Calculation of Effective Force F_e

The Effective Force F_e can be calculated with the existing movement resistance as follows:

$$F_e = \sum F_{Resistance} \times F_{Stress} \quad \text{Quod vide} \rightarrow \text{conveying applications}$$

Furthermore the effective force can also be calculated with the existing driving power as follows:

$$F_e = (T_{Motor} \times 1000) / r_{pulley}$$

or

$$F_e = (19100 \times P_{Motor} \times 500) / (n \times r_{pulley})$$

b. Calculation of Force for Pre-tensioning F_{pre}

For trouble-free operation, it is necessary that the slack side does not fall below a certain tension. The pre-tension prevents jumping of the pulley teeth during belt operation. In order to collect the pre-tension, the optimal slack side force has to be ascertained as follows:

$$F_{2opt} = (0,1 \dots 0,3) \times F_e$$

Higher values are recommended for longer belt lengths.

Assuming an optimal slack side force, the force for pre-tensioning is calculated considering the tight side length L_1 and the total timing belt length L as follows:

$$F_{pre} = F_{2opt} + F_e \times \frac{L_1}{L}$$

c. Calculation of Tight Side Belt Force F_1

In the worst case the tight side belt force F_1 results as follows (application moving at full load):

$$F_1 = F_e + F_{pre}$$

d. Belt Selection

To select the matching application for the belt type and width by using the values determined above (F_e and F_1) have to be compared with the valid data from our catalog. After the first selection, the resulting pulley teeth have to be detected. The determined number of teeth and the angle of contact are the basis for the number of teeth which are constantly engaged to the pulley and which can be used for power transmissions. The allowable effective force F_{eall} for the number of teeth smaller than 15 has to be rectified with the help of a tooth in mesh factor t_m which can be taken from *table 1*. The same method is allowed for conveying velocity. The needed speed factor t_v for speed can be taken from *table 2*. The outcome is a maximum allowable effective force application as follows:

$$F_{eallapp} = F_{eall} \times t_m \times t_v$$

$F_{eallapp}$ and F_{1all} should be larger than the actual prevailing forces in the application.

$$F_{eallapp} > F_e$$

$$F_{1all} > F_1$$

e. Calculation of Safety Factor SF_i

- i. Safety factor on allowable effective force SF_{Fe}

$$SF_{Fe} = F_{eallapp} / F_e$$
- ii. Safety factor on allowable belt force SF_1

$$SF_1 = F_{1all} / F_1$$
- iii. Safety factor on ultimate tensile strength SF_{Break}

$$SF_{Break} = F_{Break} / F_1$$

7. CALCULATION OF LIFTING APPLICATIONS WITHOUT COUNTER WEIGHT, TWO SHAFTS

a. Calculation of Effective Force F_e

The effective force at the driver pulley is derived from the sum of all individual forces resisting the belt motion. The individual loads contributing to the effective force must be identified and calculated based on the loading conditions and drive configurations. To determine the effective force F_e please use the method for conveying as follows:

$$F_e = \sum F_{\text{Resistance}} \times F_{\text{Stress}}$$

i. Friction Force F_F

The friction force between the moved mass and its bearings.

$$F_F = \mu \times g \times m \times \cos\beta$$

ii. Gravitational Load F_G

Force due to mass component parallel to the direction of conveyance.

$$F_G = m \times g \times \sin\beta$$

iii. Acceleration force F_a

Force to accelerate the mass.

$$F_a = m \times a$$

iv. Further Forces

Motion resistance due to belt mass, idler or similar are normally insignificant, but may have a decisive influence on the total value of the effective force F_e and therewith on the belt load as well. The importance of mentioned influences has to be estimated throughout the calculations – in extreme cases the component forces must be calculated and considered.

b. Calculation of Factor for Pre-tensioning F_{pre}

For trouble-free operation, it is necessary that the slack side does not fall below a certain tension. The pre-tension prevents jumping of the pulley teeth during belt operation. In order to collect the pre-tension, the optimal slack side force has to be ascertained as follows:

$$F_{2\text{opt}} = (0,1 \dots 0,3) \times F_U$$

Higher values are recommended for longer belt lengths.

Assuming an optimal slack side force, the force for pre-tensioning is calculated considering the tight side length L_1 and the total timing belt length L as follows:

$$F_V = F_{2\text{opt}} + F_U \times \frac{L_1}{L}$$

c. Calculation of Tight Side Belt Force F_1

In the worst case the Tight Side Belt Force results as follows (Conveyor moving at full load):

$$F_1 = F_e + F_{pre}$$

d. Belt Selection

To select the matching application for the belt type and width by using the values determined above (F_e and F_1) have to be compared with the valid data from our catalogue. After the first selection, the resulting pulley teeth have to be detected. The determined number of teeth and the angle of contact are the basis for the number of teeth which are constantly engaged to the pulley and which can be used for power transmissions. The allowable effective force F_{eall} for the number of teeth smaller than 15 has to be rectified with the help of a tooth in mesh factor t_m which can be taken from **table 1**. The same method is allowed for conveying velocity. The needed speed factor t_v for speed can be taken from **table 2**. The outcome is a maximum allowable effective force application as follows:

$$F_{eallapp} = F_{eall} \times t_m \times t_v$$

$F_{eallapp}$ and F_{1all} should be larger than the actual prevailing forces in the application.

$$F_{eallapp} > F_e$$

$$F_{1all} > F_1$$

e. Calculation of Safety Factor SF

- i. Safety factor on allowable effective force SF_{Fe}

$$SF_{Fe} = F_{eallapp} / F_e$$

- ii. Safety factor on allowable belt force SF_1

$$SF_1 = F_{1all} / F_1$$

- iii. Safety factor on ultimate tensile strength SF_{Break}

$$SF_{Break} = F_{Break} / F_1$$

8. CALCULATION OF LIFTING APPLICATIONS, WITH COUNTER WEIGHT, 1 SHAFT

a. Calculation of Effective Force F_e

The effective force F_e at the driver pulley is derived from the sum of all individual forces resisting the belt motion. The individual loads contributing to the effective force must be identified and calculated based on the loading conditions and drive configurations. To determine the effective force please use the method for conveying as follows:

i. $F_e = m \times (g+a) - m_e \times (g-a)$

ii. Further Forces

Motion resistance due to belt mass, idler or similar are normally insignificant, but may have a decisive influence on the total value of the effective force F_e and therewith on the belt load as well. The importance of mentioned influences has to be estimated throughout the calculations – in extreme cases the component forces must be calculated and considered.

b. Calculation of Factor for Pre-tensioning F_{pre}

Not available for lifting applications with counter weight and one pulley.

c. Calculation of Tight Side Belt Force F_1

In the worst case the tight side belt force results as follows (conveyor moving at full load):

$$F_{1max} = m_{max} \times (a + g)$$

d. Belt Selection

To select the matching application for the belt type and width by using the values determined above (F_e and F_1) have to be compared with the valid data from our catalog. After the first selection, the resulting pulley teeth have to be detected. The determined number of teeth and the angle of contact are the basis for the number of teeth which are constantly engaged to the pulley and which can be used for power transmissions. The allowable effective force F_{eall} for the number of teeth smaller than 15 has to be rectified with the help of a tooth in mesh factor t_m which can be taken from *table 1*. The same method is allowed for conveying velocity. The needed speed factor t_v for speed can be taken from *table 2*. The outcome is a maximum allowable effective force application as follows:

$$F_{eallapp} = F_{Eall} \times t_m \times t_v$$

$F_{eallapp}$ and F_{1all} should be larger than the actual prevailing forces in the application.

$$F_{eallapp} > F_e$$

$$F_{1all} > F_{1max}$$

e. Calculation of Safety Factor SF

- i. Safety factor on allowable effective force SF_{Fe}

$$SF_{Fe} = F_{eallapp} / F_e$$
- ii. Safety factor on allowable belt force SF_1

$$SF_1 = F_{1all} / F_1$$
- iii. Safety factor on ultimate tensile strength SF_{Break}

$$SF_{Break} = F_{Break} / F_1$$

9. ELONGATION / POSITIONING ERROR IN TIMING BELT DRIVES**a. Elongation Δx**

The static elongation based on an applied force such as the pre-tension results as follows:

$$\Delta x = \frac{F \times L}{c_{Sp}}$$

b. Positioning Error Δx_{Pos}

The positioning error mainly depends on the total stiffness c_R of the slack and tight side.

$$c_R = c_{Sp} \times \frac{L}{L_1 \times L_2}$$

Note that c_R is at its minimum when the tight and slack sides are equal.

Determine the positioning error Δx_{Pos} due to belt elongation caused by e.g. the effective force F_e :

$$\Delta x_{Pos} = \frac{F}{c_R}$$

10. TIMING BELT CONSTRUCTION

a. Pre-tensioning F_{pre}

For proper adjustment of pre-tensioning F_{pre} Gates recommends the Sonic Tension Meter 507 C which directly specifies the pre-tension in Newton.

When using prior tension meters the conversion of the pre-tension is required. The conversion results as follows:

$$f = \sqrt{\frac{F_{pre}}{4 \times m \times l^2}}$$

b. Assembling Instructions

The timing belt should be placed around the pulleys without any tension. Using the tensioning device, apply the calculated pre-tension to the belt. After applying the pre-tension, lock all adjustable shafts into place. If the shafts are fixed, the timing belt has to be assembled together with the pulleys.

INFORMATION

The specifications listed are based on Gates experience. However, our specifications and data do NOT cover all possible belt drive conditions. It is the responsibility of the belt drive system designer to ensure Gates belts are appropriate for a given system and application. The provided data is representative of our in-house experience and does not necessarily match product performance in industrial use. Gates cannot assume any liability concerning the suitability and process ability of our products. We also cannot assume liability for process results, damages or consequential damages associated with the use of our products.

Do not use Gates belts in applications that depend solely upon the belt to raise/lower, support or sustain a mass without an independent safety backup system. Gates products are not suitable for applications in aircraft.

All information contained are subject to change without notice.

ABBREVIATIONS

Polyurethane		Belt Types	
R1	92 Shore A	R	Roll stock
R2	85 Shore A	G	Open ended
FDA	85 Shore A / FDA approval	P	Punched only belts
R3	90 Shore A / STAND cast belts	E	Endless welded belts
R4	94 Shore A / antistatic features	S	Gates Synchro Power® (Cast) Belts
EUF85	85 Shore A / suitable for food use	F	Truly Endless Flex Belts
EUF92	92 Shore A / suitable for food use		

Pitches and Cord Types		Polyamide and Special Fabrics	
SL	Steel cord	NB	Polyamide fabric on back
L	Reinforced cord	NT	Polyamide fabric on tooth side
HF	High flexible steel cord	NTB	Polyamide fabric on tooth and back
NIRO	Stainless steel cord	ECO	Antistatic ECO fabric on tooth and back
KV	Aramide cord	ATB	Antistatic fabric on tooth and back
DT	Double sided cast belts		

Approvals	
FDA	Approval by the U.S. Food and Drug Administration according to regulation no. 177.2600-Rubber Articles for repeated use
EU	EU approval for materials made of polyurethane, which are used for food applications according to the following EU regulations and guidelines: VO (EG) No. 1935 / 2004 § 4, EG Regulation 2002 / 72 / EG-completion 2007 / 19 / EG, Regulation 82 / 711 / EWG and Regulation 85 / 572 / EWG

Backings and Fabrications	
HB	High Back Backing / backing hardness depends on on belt hardness
Min. pulley diameter in mm	Pulley diameter factor x material thickness
